tinytable is a small but powerful R package to draw HTML, LaTeX, PDF, Markdown, and Typst tables. The interface is minimalist, but it gives users direct and convenient access to powerful frameworks to create endlessly customizable tables.

Install it from Github:

```
library(remotes)
install_github("vincentarelbundock/tinytable")
```

This tutorial introduces the main functions of the package. It is available in two versions:

- PDF
- HTML

1 Tiny Tables

Load the library and set some global options:

```
library(tinytable)

options(digits = 3) # how many significant digits to print by default
options("tinytable_tabularray_placement" = "H") # for LaTeX
```

Draw a first table:

```
x <- mtcars[1:4, 1:5]
tt(x)
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

1.1 Output formats

tinytable can produce tables in HTML, Markdown, LaTeX, PDF, or PNG format. An appropriate output format for printing is automatically selected based on (1) whether the function is called interactively, (2) is called within RStudio, and (3) the output format of

the Rmarkdown or Quarto document, if applicable. Alternatively, users can specify the print format in print() or by setting a global option:

```
tt(x) |> print("markdown")
tt(x) |> print("html")
tt(x) |> print("latex")

options(tinytable_print_output = "markdown")
```

With the save_tt() function, users can also save tables directly to PNG images or PDF documents, or any of the basic formats. All we need to do is supply a valid file name with the appropriate extension (ex: .png, .html, .pdf, etc.):

```
tt(x) |> save_tt("path/to/file.png")
tt(x) |> save_tt("path/to/file.pdf")
tt(x) |> save_tt("path/to/file.html")
tt(x) |> save_tt("path/to/file.tex")
tt(x) |> save_tt("path/to/file.md")
```

save_tt() can also return a string with the table in it, for further processing in R. In the first
case, the table is printed to console with cat(). In the second case, it returns as a single string
as an R object.

```
tt(mtcars[1:10, 1:5]) |>
group_tt(
    i = list(
        "Hello" = 3,
        "World" = 8),
    j = list(
        "Foo" = 2:3,
        "Bar" = 4:5)) |>
print("markdown")
```

```
| 18.1 | 6
           | 225
                  | 105 | 2.76 |
                  | 245 | 3.21 |
| 14.3 | 8
           360
| World
| 24.4 | 4
           | 146.7 | 62 | 3.69 |
| 22.8 | 4
           | 140.8 | 95 | 3.92 |
+----+
  tt(mtcars[1:10, 1:5]) |>
   group_tt(
     i = list(
       "Hello" = 3,
       "World" = 8),
     j = list(
       "Foo" = 2:3,
       "Bar" = 4:5)) >
   save_tt("markdown")
[1] "+----+\n|
                                          | Foo
                                                      | Bar
```

1.2 Themes

22.8 | 4

| 21.4 | 6

| 18.7 | 8

| 108

| 258

| 360

| 93 | 3.85 |

| 110 | 3.08 |

| 175 | 3.15 |

tinytable offers a few basic themes out of the box: "default", "striped", "grid", "void." Those themes can be applied with the theme argument of the tt() function. As we will see below, it is easy to go much beyond those basic settings to customize your own tables. Here we only illustrate a few of the simplest settings:

```
tt(x, theme = "striped")
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

```
tt(x, theme = "grid")
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

```
tt(x, theme = "void")
                                              \operatorname{disp}
                                                      hp
                                                             \operatorname{drat}
                                 mpg cyl
                                 21
                                               160
                                                      110
                                                            3.9
                                 21
                                              160
                                                      110
                                                            3.9
                                 22.8
                                                      93
                                                            3.85
                                              108
                                 21.4
                                                            3.08
                                               258
                                                      110
```

1.3 Alignment

To align columns, we use a single character, or a string where each letter represents a column:

```
dat <- data.frame(
    a = c("a", "aa", "aaa"),
    b = c("b", "bb", "bbb"),
    c = c("c", "cc", "ccc"))

tt(dat) |> style_tt(align = "c")
```

a	b	c
a	b	\mathbf{c}
aa	bb	cc
aaa	bbb	ccc

```
tt(dat) |> style_tt(j = 1:3, align = "lcr")
```

a	b	С
a	b	c
aa	bb	cc
aaa	bbb	ccc

1.4 Formatting (numbers, dates, strings, etc.)

The tt() function is minimalist; it's inteded purpose is simply to draw nice tables. Users who want to format numbers, dates, strings, and other variables in different ways should process their data *before* supplying it to the tt() table-drawing function. To do so, we can use the format_tt() function supplied by the tinytable.

In a very simple case—such as printing 2 significant digits of all numeric variables—we can use the digits argument of tt():

```
dat <- data.frame(
    w = c(143002.2092, 201399.181, 100188.3883),
    x = c(1.43402, 201.399, 0.134588),
    y = as.Date(sample(1:1000, 3)),
    z = c(TRUE, TRUE, FALSE))

tt(dat, digits = 2)</pre>
```

W	X	у	\mathbf{Z}
143002	1.43	1971-01-22	True
201399	201.40	1970-11-13	True
100188	0.13	1972-02-11	False

We can get more fine-grained control over formatting by calling format_tt() after tt(), optionally by specifying the columns to format with j:

```
tt(dat) |>
  format_tt(
    j = 2:4,
    digits = 1,
    date = "%B %d %Y") |>
  format_tt(
    j = 1,
```

```
digits = 2,
num_mark_big = " ",
num_mark_dec = ",",
num_fmt = "decimal")
```

W	X	у	Z
143 002,21	1.4	January 22 1971	True
201 399,18	201.4	November 13 1970	True
100 188,39	0.1	February 11 1972	False

We can use a regular expression in j to select columns, and the ?sprintf function to format strings, numbers, and to do string interpolation (similar to the glue package, but using Base R):

```
dat <- data.frame(
    a = c("Burger", "Halloumi", "Tofu", "Beans"),
    b = c(1.43202, 201.399, 0.146188, 0.0031),
    c = c(98938272783457, 7288839482, 29111727, 93945))
tt(dat) |>
    format_tt(j = "a", sprintf = "Food: %s") |>
    format_tt(j = 2, digits = 1) |>
    format_tt(j = "c", digits = 2, num_suffix = TRUE)
```

a	b	\mathbf{c}
Food: Burger	1.432	98.94T
Food: Halloumi	201.399	7.29B
Food: Tofu	0.146	29.11M
Food: Beans	0.003	$93.94\mathrm{K}$

Finally, if you like the format_tt() interface, you can use it directly with numbers, vectors, or data frames:

```
format_tt(pi, digits = 1)
[1] "3"
```

```
format_tt(dat, digits = 1, num_suffix = TRUE)
```

```
a b c
1 Burger 1.4 98.9T
2 Halloumi 201.4 7.3B
3 Tofu 0.1 29.1M
4 Beans 0.0 93.9K
```

1.5 Width

The width arguments accepts a number between 0 and 1, indicating what proportion of the linewidth the table should cover:

$$tt(x, width = 0.5)$$

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

$$tt(x, width = 1)$$

mpg	cyl	disp	hp	drat	
21	6	160	110	3.9	
21	6	160	110	3.9	
22.8	4	108	93	3.85	
21.4	6	258	110	3.08	

1.6 Line breaks and text wrapping

When the width argument is specified and a cell includes long text, the text is automatically wrapped to match the table.

```
lorem <- data.frame(
   Lorem = "Sed ut perspiciatis unde omnis iste natus error sit voluptatem accusantium dolo
   Ipsum = " Nemo enim ipsam voluptatem quia voluptas sit aspernatur aut odit aut fugit, se
)
tt(lorem, width = 3/4)</pre>
```

Table 1: A full width table with wrapped text.

Lorem	Ipsum
Sed ut perspiciatis unde omnis iste natus error sit voluptatem accusantium doloremque laudantium, totam rem aperiam, eaque ipsa quae ab illo inventore veritatis et quasi architecto beatae vitae dicta sunt explicabo.	Nemo enim ipsam voluptatem quia voluptas sit aspernatur aut odit aut fugit, sed quia consequ- untur magni dolores eos.

Manual line breaks work sligthly different in LaTeX (PDF) or HTML. This table shows the two strategies. For HTML, we insert a
br> tag. For LaTeX, we wrap the string in curly braces {}, and then insert two (escaped) backslashes: \\\

```
d <- data.frame(
  "{Sed ut \\\\ perspiciatis unde}",
  "dicta sunt<br> explicabo. Nemo"
) |> setNames(c("LaTeX line break", "HTML line break"))
tt(d, width = 1)
```

LaTeX line break	HTML line break
Sed ut perspiciatis unde	dicta sunt explicabo. Nemo

1.7 Captions and cross-references

In Quarto, one can specify captions and use cross-references using code like this:

```
@tbl-blah shows that...
```{r}
```

Table 2: Blah blah blah

mpg	cyl	disp	hp
21	6	160	110
21	6	160	110
22.8	4	108	93
21.4	6	258	110

```
#| label: tbl-blah
#| tbl-cap: "Blah blah blah"
library(tinytable)
tt(mtcars[1:4, 1:4])
```

And here is the rendered version of the code chunk above:

Table 2 shows that...

```
library(tinytable)
tt(mtcars[1:4, 1:4], placement = NULL)
```

For standalone LaTeX tables, you can use the caption argument like so:

```
tt(x, caption = "Blah blah.\\label{tbl-blah}")
```

Be aware that this more approach may not work well in Quarto or Rmarkdown documents.

#### 1.8 Footnotes

The notes argument accepts single strings or named lists of strings:

```
n <- "Fusce id ipsum consequat ante pellentesque iaculis eu a ipsum. Mauris id ex in nulla
tt(lorem, notes = n, width = 1)</pre>
```

Table 3: A full-width table with wrapped text in cells and a footnote.

Lorem	Ipsum
Sed ut perspiciatis unde omnis iste natus error sit voluptatem accusantium doloremque laudantium, totam rem aperiam, eaque ipsa quae ab illo inventore veritatis et quasi architecto beatae vitae dicta sunt explicabo.	Nemo enim ipsam voluptatem quia voluptas sit aspernatur aut odit aut fugit, sed quia consequuntur magni dolores eos.

Fusce id ipsum consequat ante pellentesque iaculis eu a ipsum. Mauris id ex in nulla consectetur aliquam. In nec tempus diam. Aliquam arcu nibh, dapibus id ex vestibulum, feugiat consequat erat. Morbi feugiat dapibus malesuada. Quisque vel ullamcorper felis. Aenean a sem at nisi tempor pretium sit amet quis lacus.

When **notes** is a named list, the names are used as identifiers and displayed as superscripts:

```
tt(x, notes = list(a = "Blah.", b = "Blah blah."))
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

<sup>&</sup>lt;sup>a</sup> Blah.

#### 1.9 Math

In LaTeX and MathJax (for HTML), there are two main ways to enclose mathematical expressions, either between dollar signs or escaped parentheses: \$...\$ or \(\ldot(...\rangle)\). The first strategy is discouraged by MathJax, because dollar signs are very common in non-mathematical contexts, which can cause rendering errors. In that spirit, tinytable will not render dollar-enclosed strings as mathematical expressions in HTML. Following the default MathJax settings, tinytable expects users to employ the escaped parentheses strategy:

```
dat <- data.frame(Math = c(
 "\\(x^2 + y^2 = z^2 \\)",
 "\\(\\frac{1}{2} \\)"
))</pre>
```

<sup>&</sup>lt;sup>b</sup> Blah blah.

In LaTeX (PDF), you can also use the mode inner setting from tabularray to render math in tables without delimiters (see Section 5 for details on tabularray):

### 2 Style

The main styling function for the tinytable package is style\_tt(). Via this function, you can access three main interfaces to customize tables:

- 1. A general interface to frequently used style choices which works for both HTML and LaTeX (PDF): colors, font style and size, row and column spans, etc. This is accessed through several distinct arguments in the style\_tt() function, such as italic, color, etc.
- 2. A specialized interface which allows users to use the powerful tabularray package to customize LaTeX tables. This is accessed by passing tabularray settings as strings to the tabularray\_inner and tabularray\_outer arguments of style\_tt().
- 3. A specialized interface which allows users to use the powerful Bootstrap framework to customize HTML tables. This is accessed by passing CSS declarations and rules to the bootstrap\_css and bootstrap\_css\_rule arguments of style\_tt().

These functions can be used to customize rows, columns, or individual cells. They control many features, including:

- Text color
- Background color

- Widths
- Heights
- Alignment
- Text Wrapping
- Column and Row Spacing
- Cell Merging
- Multi-row or column spans
- Border Styling
- Font Styling: size, underline, italic, bold, strikethrough, etc.
- Header Customization

The style\_\*() functions can modify individual cells, or entire columns and rows. The portion of the table that is styled is determined by the i (rows) and j (columns) arguments.

### 2.1 Cells, rows, columns

To style individual cells, we use the style\_cell() function. The first two arguments—i and j—identify the cells of interest, by row and column numbers respectively. To style a cell in the 2nd row and 3rd column, we can do:

```
tt(x) |>
 style_tt(
 i = 2,
 j = 3,
 background = "black",
 color = "white")
```

	mpg	cyl	$\operatorname{disp}$	hp	$\operatorname{drat}$
-	21	6	160	110	3.9
	21	6	160	110	3.9
	22.8	4	108	93	3.85
	21.4	6	258	110	3.08

The i and j accept vectors of integers to modify several cells at once:

```
tt(x) |>
 style_tt(
 i = 2:3,
 j = c(1, 3, 4),
```

```
italic = TRUE,
color = "orange")
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

We can style all cells in a table by omitting both the  $\mathtt{i}$  and  $\mathtt{j}$  arguments:

```
tt(x) |> style_tt(color = "orange")
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

We can style entire rows by omitting the j argument:

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

We can style entire columns by omitting the i argument:

```
tt(x) > style_tt(j = c(2, 4), bold = TRUE)
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

The j argument accepts integer vectors, but also a string with a Perl-style regular expression, which makes it easier to select columns by name:

```
tt(x) |> style_tt(j = "mpg|drat", color = "orange")
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

Of course, we can also call the **style\_tt()** function several times to apply different styles to different parts of the table:

```
tt(x) |>
 style_tt(i = 1, j = 1:2, color = "orange") |>
 style_tt(i = 1, j = 3:4, color = "green")
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

#### 2.2 Colors

The color and background arguments in the style\_tt() function are used for specifying the text color and the background color for cells of a table created by the tt() function. This argument plays a crucial role in enhancing the visual appeal and readability of the table,

whether it's rendered in LaTeX or HTML format. The way we specify colors differs slightly between the two formats:

#### For HTML Output:

- Hex Codes: You can specify colors using hexadecimal codes, which consist of a # followed by 6 characters (e.g., #CC79A7). This allows for a wide range of colors.
- Keywords: There's also the option to use color keywords for convenience. The supported keywords are basic color names like black, red, blue, etc.

#### For LaTeX Output:

- Hexadecimal Codes: Similar to HTML, you can use hexadecimal codes. However, in LaTeX, you need to include these codes as strings (e.g., "#CC79A7").
- Keywords: LaTeX supports a different set of color keywords, which include standard colors like black, red, blue, as well as additional ones like cyan, darkgray, lightgray, etc.
- Color Blending: An advanced feature in LaTeX is color blending, which can be achieved using the xcolor package. You can blend colors by specifying ratios (e.g., white!80!blue or green!20!red).
- Luminance Levels: The ninecolors package in LaTeX offers colors with predefined luminance levels, allowing for more nuanced color choices (e.g., "azure4", "magenta8").

Note that the keywords used in LaTeX and HTML are slightly different.

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

Note that when using Hex codes in a LaTeX table, we need extra declarations in the LaTeX preamble. See ?tt for details.

#### 2.3 Fonts

The font size is specified in terms of pt units, where 1pt=1.333px:

```
tt(x) |> style_tt(j = "mpg|hp|qsec", fontsize = 18)
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

### 2.4 Spanning cells

Sometimes, it can be useful to make a cell stretch across multiple colums, for example when we want to insert a label. To achieve this, we can use the colspan argument. Here, we make the 2nd cell of the 2nd row stretch across three columns:

```
tt(x)|> style_tt(
 i = 2, j = 2,
 colspan = 3,
 align = "c",
 color = "white",
 background = "black")
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21		6		3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

Here is the original table for comparison:

```
tt(x)
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

### 2.5 Headers

The header can be omitted from the table by deleting the column names in the x data frame:

```
k <- x
colnames(k) <- NULL
tt(k)</pre>
```

21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

The header is row 0, and can thus be styled as expected:

```
tt(x) |> style_tt(i = 0, color = "white", background = "black")
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

### 2.6 Conditional styling

We can use the standard which function from Base R to create indices and apply conditional stying on rows. And we can use a regular expression in j to apply conditional styling on columns:

```
k <- mtcars[1:10, c("mpg", "am", "vs")]

tt(k) |>
 style_tt(
 i = which(k$am == k$vs),
 background = "teal",
 color = "white")
```

mpg	am	vs
21	1	0
21	1	0
22.8	1	1
21.4	0	1
18.7	0	0
18.1	0	1
14.3	0	0
24.4	0	1
22.8	0	1
19.2	0	1

# 2.7 Vectorized styling (heatmaps)

The color, background, and fontsize arguments are vectorized. This allows easy specification of different colors in a single call:

```
tt(x) |>
 style_tt(
 i = 1:4,
 color = c("red", "blue", "green", "orange"))
```

mpg	cyl	disp	hp	drat	
21	6	160	110	3.9	
21	6	160	110	3.9	
22.8	4	108	93	3.85	
21.4	6	258	110	3.08	

When using a single value for a vectorized argument, it gets applied to all values:

```
tt(x) |>
 style_tt(
 j = 2:3,
 color = c("orange", "green"),
 background = "black")
```

mpg	cyl	disp	hp	drat
21	6	160	110	3.9
21	6	160	110	3.9
22.8	4	108	93	3.85
21.4	6	258	110	3.08

We can also produce more complex heatmap-like tables:

```
A table without header
k <- data.frame(matrix(1:20, ncol = 5))
colnames(k) <- NULL

20 levels of Inferno colors
bg <- hcl.colors(20, "Inferno")
fg <- ifelse(as.matrix(k) < 17, tail(bg, 1), head(bg, 1))
fs <- 1:20

tt(k, width = .5, theme = "void") |>
style_tt(j = 1:5, align = "ccccc") |>
style_tt(
i = 1:4,
j = 1:5,
color = fg,
background = bg,
fontsize = fs)
```

		9	13	17
2		10	14	18
3		11		19
4	8	12	16	20

# 3 Groups and labels

The group\_tt() function can label groups of rows (i) or columns (j).

### **3.1 Rows**

The i argument accepts a named list of integers. The numbers identify the positions where row group labels are to be inserted. The names includes the text that should be inserted:

```
dat <- mtcars[1:9, 1:8]

tt(dat) |>
 group_tt(i = list(
 "I like (fake) hamburgers" = 3,
 "She prefers halloumi" = 4,
 "They love tofu" = 7))
```

mpg	cyl	disp	hp	drat	wt	qsec	vs
21	6	160	110	3.9	2.62	16.46	0
21	6	160	110	3.9	2.875	17.02	0
I like (fa	ake) ł	namburg	gers				
22.8	4	108	93	3.85	2.32	18.61	1
She pre	fers h	alloumi					
21.4	6	258	110	3.08	3.215	19.44	1
18.7	8	360	175	3.15	3.44	17.02	0
18.1	6	225	105	2.76	3.46	20.22	1
They lo	ve tof	u					
14.3	8	360	245	3.21	3.57	15.84	0
24.4	4	146.7	62	3.69	3.19	20	1
22.8	4	140.8	95	3.92	3.15	22.9	1

We can style group rows in the same way as regular rows:

```
tt(dat) |>
 group_tt(
 i = list(
```

```
"I like (fake) hamburgers" = 3,
 "She prefers halloumi" = 4,
 "They love tofu" = 7)) |>
style_tt(
 i = c(3, 5, 9),
 align = "c",
 color = "white",
 background = "gray",
 bold = TRUE)
```

mpg	cyl	disp	hp	drat	wt	qsec	vs
21	6	160	110	3.9	2.62	16.46	0
21	6	160	110	3.9	2.875	17.02	0
	I	like (f	ake)	hambı	ırgers		
22.8	4	108	93	3.85	2.32	18.61	1
		She p	refers	s hallo	umi		
21.4	6	258	110	3.08	3.215	19.44	1
18.7	8	360	175	3.15	3.44	17.02	0
18.1	6	225	105	2.76	3.46	20.22	1
		$\operatorname{Th}$	ey lo	ve tof	u		
14.3	8	360	245	3.21	3.57	15.84	0
24.4	4	146.7	62	3.69	3.19	20	1
22.8	4	140.8	95	3.92	3.15	22.9	1

### 3.2 Columns

The syntax for column groups is very similar, but we use the j argument instead. The named list specifies the labels to appear in column-spanning labels, and the values must be a vector of consecutive and non-overlapping integers that indicate which columns are associated to which labels:

```
tt(dat) |>
 group_tt(
 j = list(
 "Hamburgers" = 1:3,
 "Halloumi" = 4:5,
```

"Tofu" = 7))

Ha	mbur	gers	Hall	oumi		Tofu	
mpg	$\operatorname{cyl}$	disp	hp	drat	wt	qsec	vs
21	6	160	110	3.9	2.62	16.46	0
21	6	160	110	3.9	2.875	17.02	0
22.8	4	108	93	3.85	2.32	18.61	1
21.4	6	258	110	3.08	3.215	19.44	1
18.7	8	360	175	3.15	3.44	17.02	0
18.1	6	225	105	2.76	3.46	20.22	1
14.3	8	360	245	3.21	3.57	15.84	0
24.4	4	146.7	62	3.69	3.19	20	1
22.8	4	140.8	95	3.92	3.15	22.9	1

Here is a table with both row and column headers, as well as some styling:

На	mbur	gers	Hall	oumi		Tofu	
mpg	cyl	disp	hp	drat	wt	qsec	vs
21	6	160	110	3.9	2.62	16.46	0
21	6	160	110	3.9	2.875	17.02	0
		I like (	fake) l	hambu	rgers		
22.8	4	108	93	3.85	2.32	18.61	1
		She p	prefers	hallou	ımi		
21.4	6	258	110	3.08	3.215	19.44	1
18.7	8	360	175	3.15	3.44	17.02	0
18.1	6	225	105	2.76	3.46	20.22	1
		$\mathbf{T}$	hey lo	ve tofu			
14.3	8	360	245	3.21	3.57	15.84	0
24.4	4	146.7	62	3.69	3.19	20	1
22.8	4	140.8	95	3.92	3.15	22.9	1

### 4 HTML customization

The HTML customization options described in this section are not available for LaTeX (or PDF) documents. Please refer to the web documentation to read this part of the tutorial.

### 4.1 Themes

#### 4.2 CSS declarations

#### 4.3 CSS rules

# 5 LaTeX / PDF customization

### 5.1 Preamble

Warning: Some of the features of this package may require a recent version of the tabularray package. Please update your local LaTeX distribution before using tinytable.

In Rmarkdown and Quarto documents, tinytable will automatically populate your LaTeX preamble with the necessary packages and commands. When creating your own LaTeX documents, you should insert these commands in the preamble:

```
\usepackage{tabularray}
\usepackage{float}
\usepackage{codehigh}
\usepackage[normalem]{ulem}
\UseTblrLibrary{booktabs}
\NewTableCommand{\tinytableDefineColor}[3]{\definecolor{#1}{#2}{#3}}
\newcommand{\tinytableTabularrayUnderline}[1]{\underline{#1}}
\newcommand{\tinytableTabularrayStrikeout}[1]{\sout{#1}}
```

### 5.2 Introduction to tabularray

tabularray offers a robust solution for creating and managing tables in LaTeX, standing out for its flexibility and ease of use. It excels in handling complex table layouts and offers enhanced functionality compared to traditional LaTeX table environments. This package is particularly useful for users requiring advanced table features, such as complex cell formatting, color management, and versatile table structures.

A key feature of Tabularray is its separation of style from content. This approach allows users to define the look and feel of their tables (such as color, borders, and text alignment) independently from the actual data within the table. This separation simplifies the process of formatting tables and enhances the clarity and maintainability of LaTeX code. The tabularray documentation is fantastic. It will teach you how to customize virtually every aspect of your tables: https://ctan.org/pkg/tabularray?lang=en

Tabularray introduces a streamlined interface for specifying table settings. It employs two types of settings blocks: Inner and Outer. The Outer block is used for settings that apply to the entire table, like overall alignment, while the Inner block handles settings for specific elements like columns, rows, and cells. The style\_tt() function includes tabularray\_inner and tabularray\_outer arguments to set these respective features.

Consider this tabularray example, which illustrates the use of inner settings:

The Inner block, enclosed in {}, defines specific styles like column formats (column{1-4}={halign=c}), horizontal and vertical line colors (hlines={fg=white}, vlines={fg=white}), and cell colorations (cell{1,6}{odd}={bg=teal7}, etc.). The last line of the inner block also species that the second cell of row 2 (cell{2}{2}) should span 4 rows and 2 columns ({r=4,c=3}), be centered (halign=c), and with a background color with the 7th luminance level of the azure color (bg=azure7).

We can create this code easily by passing a string to the tabularray\_inner argument of the style\_tt() function:

```
inner <- "
column{1-4}={halign=c},
hlines = {fg=white},
vlines = {fg=white},
cell{1,6}{odd} = {bg=teal7},
cell{1,6}{even} = {bg=green7},
cell{2,4}{1,4} = {bg=red7},
cell{3,5}{1,4} = {bg=purple7},
cell{2}{2} = {r=4,c=2}{bg=azure7},
"
mtcars[1:5, 1:4] |>
tt(theme = "void") |>
style_tt(tabularray_inner = inner)
```

Table 4:  $\LaTeX$  table with colors and a spanning cell.

mpg	cyl	disp	hp
21			110
21		6	110
22.8		93	
21.4		110	
18.7	8	360	175

# 5.3 tabularray keys

Inner specifications:

Key	Description and Values	Initial Value
rulesep	space between two hlines or vlines	2pt
stretch	stretch ratio for struts added to cell text	1
abovesep	set vertical space above every row	2pt
belowsep	set vertical space below every row	2pt
rowsep	set vertical space above and below every row	2pt
leftsep	set horizontal space to the left of every column	6pt
rightsep	set horizontal space to the right of every column	6pt
colsep	set horizontal space to both sides of every column	6pt
hspan	horizontal span algorithm: default, even, or minimal	default
vspan	vertical span algorithm: default or even	default
baseline	set the baseline of the table	m

### Outer specifications:

Key	Description and Values	Initial Value
baseline	set the baseline of the table	m
long	change the table to a long table	None
tall	change the table to a tall table	None
expand	you need this key to use verb commands	None

Cells:

Key	Description and Values	Initial Value
halign	horizontal alignment: 1 (left), c (center), r (right) or j (justify)	
valign	vertical alignment: t (top), m (middle), b (bottom), h (head) or f	t
	(foot)	
wd	width dimension	None
bg	background color name	None
fg	foreground color name	None
font	font commands	None
mode	set cell mode: math, imath, dmath or text	None
cmd	execute command for the cell text	None
preto	prepend text to the cell	None
appto	append text to the cell	None
r	number of rows the cell spans	1
С	number of columns the cell spans	1

### Rows:

		Initial
Key	Description and Values	Value
halign	horizontal alignment: 1 (left), c (center), r (right) or j (justify)	
valign	vertical alignment: t (top), m (middle), b (bottom), h (head) or f	t
	(foot)	
ht	height dimension	None
bg	background color name	None
fg	foreground color name	None
font	font commands	None
mode	set mode for row cells: math, imath, dmath or text	None
cmd	execute command for every cell text	None
abovesep	set vertical space above the row	2pt
belowsep	set vertical space below the row	2pt
rowsep	set vertical space above and below the row	2pt
preto	prepend text to every cell (like > specifier in rowspec)	None
appto	append text to every cell (like < specifier in rowspec)	None

# Columns:

Key	Description and Values	Initial Value
halign	horizontal alignment: 1 (left), c (center), r (right) or j (justify)	j

Key	Description and Values	Initial Value
valign	vertical alignment: t (top), m (middle), b (bottom), h (head) or f	t
O	(foot)	
wd	width dimension	None
со	coefficient for the extendable column (X column)	None
bg	background color name	None
fg	foreground color name	None
font	font commands	None
mode	set mode for column cells: math, imath, dmath or text	None
cmd	execute command for every cell text	None
leftsep	set horizontal space to the left of the column	6pt
rightsep	set horizontal space to the right of the column	6pt
colsep	set horizontal space to both sides of the column	6pt
preto	prepend text to every cell (like > specifier in colspec)	None
appto	append text to every cell (like < specifier in colspec)	None

### hlines:

Key	Description and Values	Initial Value
dash	dash style: solid, dashed or dotted	solid
text	replace hline with text (like! specifier in rowspec)	None
wd	rule width dimension	0.4pt
fg	rule color name	None
leftpos	crossing or trimming position at the left side	1
rightpos	crossing or trimming position at the right side	1
endpos	adjust leftpos/rightpos for only the leftmost/rightmost column	false

### vlines:

Key	Description and Values	Initial Value
dash	dash style: solid, dashed or dotted	solid
text	replace vline with text (like! specifier in colspec)	None
wd	rule width dimension	0.4pt
fg	rule color name	None
abovepos	crossing or trimming position at the above side	0
belowpos	crossing or trimming position at the below side	0
